

A. Describe your Event

On my product website, I will add an event-handling interaction to the flashcard generator form. The user will interact with the topic input field. When the input gains focus, a message will appear below it reminding the user that the topic cannot be blank and must be under 80 characters. When the field loses focus, a second event checks if the input is valid; if not, an error message displays in red. When the user submits the form, the event handler will prevent the page from refreshing and will instead show a confirmation message saying the responses were recorded. This event process improves usability by guiding the user in real time.
